Project Name	Credit card approval
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Pre- application	FORM submission	RESULT generation
Actions <i>What does the customer do?</i>	Searches online for a credit card application form. Gathers necessary personal and financial documents (like income records).	•Types data into the form fields (Income, Age, Family details, etc.). Clicks the "Submit" or "Predict" button to process the data.	•Reads the automated status output message on the screen. Reviews the approval or rejection notification parameters.
Touchpoint <i>What part of the service do they interact with?</i>	•Web browser search engine. The project landing/home page	•The interactive HTML input form page. The submit button interface.	•The dynamic application results window (result.html).
Customer Thought <i>What is the customer thinking?</i>	•"I hope my credit history is good enough to get approved." "Will this system tell me my results quickly?"	•"Did I enter my annual income correctly?" "Is the backend web server processing my data safely?"	•Great, I got an immediate decision without waiting for days!" "The machine learning model is incredibly fast."

			•
Customer Feeling <i>What is the customer feeling?</i>	Anxious, hopeful, curious.	Focused, slightly nervous	Relieved, satisfied, or informed.
Process Ownership <i>Who is in the lead on this?</i>	Frontend Developer / UI Design Team	Full-Stack Developer / Application Integration Team	Machine Learning Engineer / Backend Developer
Opportunities <i>How can we improve this stage?</i>	•Create a clean, welcoming landing page that explains exactly what data the user needs to provide. Add a simple FAQ section about how credit scoring generally works	•Add real-time form validation so if a user types text into an income box, an error message guides them immediately. Keep the form layout short and compact so the applicant doesn't get overwhelmed by too many questions.	•Optimize the backend script to process the model prediction in under a second so the user gets an instant result. Provide clear visual indicators (like a bright green box for "Approved" or a soft red box for "Not Approved") to make the result easy to understand at a single glance
